

Oz\forall n \in \mathbb{R} \text{T}_{\text{E}}\text{X Documentation}

Ozaner Hansha

What is Oz\forall n \in \mathbb{R} \text{T}_{\text{E}}\text{X}?

The eponymous Oz\forall n \in \mathbb{R} \text{T}_{\text{E}}\text{X} is a $\text{T}_{\text{E}}\text{X}$ package of miscellaneous commands, preformatting, and default package inclusions. Rather than append these definitions at the top of all my $\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ files, I decided to factor them out as a package.

This document will serve as documentation, both in the form of examples and rationale, of this package. It also serves as a sort of unit test because, if it compiles, the package probably works.

Contents

0	Preformatting	2
0.1	Margins	2
0.2	Title starting height	2
0.3	Hyper-reference styling	2
1	Base packages	2
2	Textual Commands	3
2.1	\Ozaner & \Ozanerbf	3
3	Calculus Commands	3
3.1	\evalb	3
3.2	\diff	3
4	Set Theory Commands	3
4.1	\pset	3
4.2	\N, \Z, \Q, \R, \C, \H	4

0 Preformatting

0.1 Margins

Via the `geometry` package, the default margin size has been changed to 1.5in. For reference, the article document class uses a margin size of 1.875in.

0.2 Title starting height

Using the `titling` package, the starting height of the title has been set back by 7em.

0.3 Hyper-reference styling

Instead of colored boxes, hyper-references use colored text instead:

- Internal link: [blue](#)
- File link: [magenta](#)
- URL: [cyan](#)

1 Base packages

The `\usepackage` declarations. These are packages that I use commonly enough to simply include in every document. These packages are, in order of inclusion, listed below:

Note: Nested bullets denote packages that are included as dependencies of the parent bullet. These are only listed if I use them independently of their parent package.

- `fontenc`: properly renders certain special characters in text-mode.
- `geometry`: used to adjust the document margins.
- `titling`: used to push back the title starting height.
- `hyperref`: adds commands for hyper-referencing, and adds hyper-references to the table of contents.
- `amssymb`: Adds many useful mathematical symbols (e.g. blackboard bold letters (\mathbb{R}), arrows (\curvearrowright), inequalities (\nless), etc.).
- `physics`: adds a whole bunch of common functions (i.e. trig, logs, exp, matrix ops) as well as commands for typesetting matrices, derivatives, and vectors. Crucially, can now use `\mathbf{v}` (`\vb{v}`) instead of `\vec{v}` (`\vec{v}`) for vectors.
 - `amsmath`: A general math package that adds many misc. features including: equation alignment, matrix environments, fraction variants, extensible arrows, creating operators, and substacks.

2 Textual Commands

2.1 `\Ozoner` & `\Ozonerbf`

`\Ozoner{}` \longrightarrow $Oz\forall n\in\mathbb{R}$
`\Ozonerbf{}` \longrightarrow **$Oz\forall n\in\mathbb{R}$**

The stylized version of my name I use in various places, including this package. The bolded version (i.e. `\Ozonerbf`) is necessary as `\textbf` won't boldface embedded math symbols.

Note: to typeset $Oz\forall n\in\mathbb{R}\text{TeX}$ simply append `\TeX` to the command, i.e. `\Ozoner\TeX{}`.

3 Calculus Commands

3.1 `\evalb`

`\evalb{f(x)}{a}{b}` $\longrightarrow [f(x)]_a^b$

Intended to denote the result of a definite integral after integration, but before evaluation:

$$\int_0^5 2x \, dx = [x^2]_0^5 = 5^2 - 0^2$$

3.2 `\diff`

`\diff x` $\longrightarrow dx$

The `\diff` is simply the `\dd` command, from the `physics` package, prepended with a space. It, along with a variable following it, are intended to be used as the differential in an integral:

$$\int x \, dx = x^2 + C$$

Without the prepended space, i.e. using `\dd`, the differential is too close to the integrand:

$$\int x dx = x^2 + C$$

4 Set Theory Commands

4.1 `\pset`

`\pset X` $\longrightarrow \mathcal{P}(X)$

Used to denote the powerset of some set X . For example:

$$\mathcal{P}(\{1, 2\}) = \{\emptyset, \{1\}, \{2\}, \{1, 2\}\}$$

4.2 $\backslash N$, $\backslash Z$, $\backslash Q$, $\backslash R$, $\backslash C$, $\backslash H$

$$\backslash N \longrightarrow \mathbb{N} \quad \backslash R \longrightarrow \mathbb{R}$$

$$\backslash Z \longrightarrow \mathbb{Z} \quad \backslash C \longrightarrow \mathbb{C}$$

$$\backslash Q \longrightarrow \mathbb{Q} \quad \backslash H \longrightarrow \mathbb{H}$$

These are simply shorthands for the sets of 6 common number systems. Note that the quaternions command ($\backslash H$) overrides a different, unimportant, command.
